

Harsh Chaturvedi

Senior Software Engineer

harsh.chaturvedi10@gmail.com - +91 866-734-4876
Bengaluru, India - <https://linkedin.com/in/harsh-chaturvedi-46a58877/>

Senior Full Stack Engineer with 10 years of experience specializing in building scalable, event-driven, distributed systems that power core business platforms. A proven leader and mentor for a 6+ person engineering team, driving projects through the full SDLC using agile methodologies and secure coding practices.

Skills

- Languages: C# | SQL | TypeScript | JavaScript
- Databases: MS SQL Server | PostgreSQL | NoSQL | MongoDB | Redis | SSRS | RDL Report | Elastic Search
- Framework: .NET (Core, Framework) | ASP.NET (Core, MVC) | Entity Framework | LINQ
- Testing: TDD | NUnit | XUnit | Moq
- Web & Front-End: Angular | jQuery | HTML | CSS | Bootstrap | JSON | XML
- Architecture: Microservices | Distributed Systems | REST | SaaS | System Design | Design Patterns
- Cloud Platform & Engineering: Azure | AWS | Algorithms | Data Structures | Low-Level/High-Level Design

Work History (10 years)

- **Blackline Systems Inc – Senior Software Engineer** *Jan 2025 – Present*
 - Financial Close Suite (Platform) –
 - Engineered a modernized auditing solution to save \$435K+ projected over 5 years via database write/cache read hybridization (\$90K+), optimizing infrastructure cost (\$145K+) and service layer processing algorithm migration (\$200K+).
 - Delivered an asynchronous, queue-based system to synchronize user and identity data across distributed services(Tenancy, IAM, Configuration), gaining high data consistency and scalability.
 - Implemented proactive monitoring using New Relic APM, setting up customized alerting for transaction traces, error rates, and latency, resulting in faster incident resolution.
- **Aurigo Software Technologies - Lead Software Engineer** *Dec 2020 – Jan 2025*
 - Aurigo Essentials Suite –
 - Drove the technical architecture and roadmap for 4 core microservices, leading a team of 6 engineers, collaborating with product and design teams of Essentials suite, powering multi-tenancy, user access control, notifications, and document management systems.
 - Built a scalable asynchronous background service for processing bulk data import via uploads (CSV/Excel), ensuring secure multi-tenant data handling and high throughput performance.
 - Designed the currency format conversion service to support configurable settings based on customer culture and location, enabling seamless multi-tenant customization.
 - Enhanced user experience by improving application form and report render performance by 15% by implementing a JSON-based currency converter for symbols and formats.
 - Aurigo Identity Service (AIS) -
 - Designed a multi-protocol SSO platform (SAML2, OAuth, OpenID Connect) for authenticated access to 4 multi-tenant applications (web + mobile), enabling security for 300+ clients.
 - Rearchitected identity platform into a distributed microservice capable of Tenant and User workflow management, by steering technical decisions across 3 dependent teams.
 - Achieved a 20% improvement in IAM performance across applications by designing a permission-based rule configurator for resource access.
 - Achieved reduction in access control development effort close to 10% per application, by designing middleware enabling token-based access control to external application API/UI.

- Config Plus -
 - Implemented no code engine enabling end users to add custom logic to product forms written in C# via draggable UI blocks in a design workspace, augmenting diverse business use cases.
 - Designed a workspace canvas UI that enables users to build business logic via attaching blocks to form events, reducing logic implementation turnaround time by 20%.
 - Enhanced backend logic block framework to capture user input and generate dynamic queries for reading / writing form controls and querying / inserting data into relational databases.
 - Built a resource management microservice to localize symbols and labels across forms, fields, SQL/SSRS reports, emails, and dashboards—ensuring consistent internationalization of user designed content.

- **Boeing India Pvt Ltd - Software Programmer** *Dec 2019 - Dec 2020*
 - Boeing Corrective Action Board (BCAB) -
 - Optimized application development effort by 25% via workflow standardization and Aircraft corrective action integration for regulatory and enforcement processes across BCAB.
 - Delivery of RFI and FAA liaison modules (penalty milestones) to FAA before agreed ETA.
 - Designed an audit and supervision data capture system across organization facilities, design user access control management across BCAB modules.

- **Aspire Systems - Senior Software Engineer** *Jun 2016 - Dec 2019*
 - Techcello -
 - Developed core product features and customer-specific SaaS requests, including code and database enhancements, along with documentation and training to secure multiple contracts worth \$25000 each.
 - Implemented Tenant and User profile management, email and SMS notification, access control management functional and caching, logging, analytics, reporting nonfunctional features.
 - Implemented background invoice generation engine utilizing Azure functions to raise invoices and integrated Stripe and PayPal payment gateway for processing payment.
 - CelloSaaS Micro services -
 - Re-engineered the monolithic application into robust micro services via side car and pub sub.
 - Led and supervised team implementing authorization, security, service discovery features.
 - Boosted developer productivity by creating CI/CD enhancements, enabling containerized application deployment through Docker replacing Azure App Services, slashing development to deployment timeline by 50%.

Education

- **SRM University** *2012 - 2016*
Bachelor of Technology, Computer Science Engineering

Projects

- API Access Management System -
 - This API application can be used to configure role-based authorization rules for a multi-tenant web app/ API microservice and demonstrate role authorization of authenticated user against the bearer token.
- Entity Extension Metadata Storage -
 - The application creates a fields list and maps the fields in a schema, thus creating a schema to field matrix to store multiple additional (virtual) fields for an entity in a SQL relational database.
 - The field and schema are defined per-tenant basis, adding flexibility to store different entity models for individual tenants.
